

Radiator installation information

THE COOLING SYSTEM MUST BE VENTED. HOT WATER OR STEAM CAN CAUSE SERIOUS BURNS OR INJURY AND/OR ENGINE DAMAGE.

This radiator is custom made for Conley Precision Engines. Each has been pressure tested at the factory. You will notice the radiator is not vented.. It is important that a surge tank (or expansion tank) be installed somewhere on the test stand or model. The venting of the system should be done at the surge tank. The following diagram is one way to vent the cooling system.
